```
force "NMANTO", possible ribonuclease BN, len: 408 aa; similar to SW:RBN_ECOLI (EMBL:L19201), rbn, Escherichia coli ribonuclease BN (EC 3.1.-..), fasta ascores; E(): 2.3e-28, 34.3% identity in 268 aa overlap. Longer than rbn at the C-terminus. Also similar to TR:08549 (EMBL:AF067083) Vitreoscilla sp. hypothetical protein (376 av), fasta scores; E(): 0, 45.0% identity in 33a aa overlap. Contains a region similar to NMA067), fasta scores; E(): 4.3e-08, 64.4% identity in 45 aa overlap.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note="NMA0701, possible pseudogene, len: 258 bp; shows weak similarity to part of SW:WRBA_ECOLI (EMBL:M99166), wrbA, Bscherichia coli Trp repressor binding protein (197 aa), fasta scores; E(): 0.064, 29.3% identity in 82 aa overlap. Also similar to part of TR:085450 (EMBL:AR067083) Vitreoscilla sp. Trp repressor binding protein (fragment) (124 aa), fasta scores; E(): 6.6e-14, 56.6% identity in 83

Description

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to an isolated refolded Neisserial surface protein a (NspA) from Neisseria meningitidis or Neisseria gonorrhoeae. The invention also relates to the method of refolding an NspA protein; an alkaline refolding buffer comprising ethanolamine and SB-12 (3-dimethyldodecylammoniopropanesulphonate) for refolding an NspA protein; a pharmaceutical composition comprising the refolding an NspA protein, a carrier and optionally one or more other Neisserial antigens; a method of preventing or treating a Neisserial infection; an antibody immunospecific correspondent of subunit vaccine for the treatment of infections characteristics which indicate that it is a potential vaccine candidate for the development of subunit vaccines for the treatment of infections caused by Neisseria meningitidis (meningococcus), which causes invasive bacterial diseases such as bacteraemia and meningitis, or Neisserial and geneses such as bacteraemia and meningitidis of Neisserial diseases such as bacteraemia and meningitidis or Neisserial diseases such as bacteraemia and meningitidis of Neisserial diseases such as bacteraemia and meningitidis of Neisseria and in the development of new antimicrobial agents, diagnostic tests and in drug screening. However, recombinantly produced proteins are frequently unable to adopt their biologically active conformations, and yields may be very low due to mis-folding and aggregation of the protein. The method of the invention provides an improved method for refolding the NspA protein, and it is possible to increase the recovery of active protein form partly purified inclusion bodies in amounts up to 100% without the need for further purification. The refolded NspA protein is useful for preparing a composition for diagnosing treating or preventing infection caused by Neisseria meningitidis or Neisseria general proverse treates meningitidis or Neisseria generaling its possible to adopt the NspA gene from Neisseria generaling its protein formation caused by Neisseria meningitidis or Neisseria me 1 ATGAAAAAAGCACTTGCCACACTGATTGCCCTCGCTCTCCCGGCCGCCGCACTGGCGGAA 60 · GGCGCATCCGGCTTTTACGTCCAAGCCGATGCCGCACACGCAAAGCCTCAAGCTCTTTA 120 GETTCTGCCAAAGGCTTCAGCCCGCGCATCTCCGCAGGCTACCGCATCAACGACCTCGC 180 TTCGCCGTCGATTACACGCGCTACAAAACTATAAAGCCCCATCCACCGATTTCAAACTT 240 61 GGGGCATCCGGCTTTTACGTCCAAGCCGATGCCGCACACGCAAAAGCCTCAAGCTCTTTA 120 GGTTCTGCCAAAGGCTTCAGCCCGCGCATCTCCGCAGGCTACCGCATCAACGACCTCCGC 180 TTCGCCGTCGATTACACGCGCTACAAAACTATAAAGCCCCATCCACCGATTTCAAACTT 240 TACAGCATCGGCGCGTCCGCCATTTACGACTTCGACACCCCAATCGCCCGTCAAACCGTAT 300 TACAGCATCGGCGTCCGCCATTTACGACTTCGACACCCCAATCGCCCGTCAAACCGTAT 300 ATGAAAAAAGCACTTGCCACACACTGATTGCCCTCGCTCTCCCGGCCGCCGCACTGGCGGAA 60 Gaps New refolded NspA protein, useful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria meningitidis or Neisseria gonorrheae. ö DB 12; Length 525; Sequence 525 BP; 117 A; 186 C; 119 G; 103 T; 0 U; 0 Other; Indels 100.0%; Score 525; DB 12; 100.0%; Pred. The present invention relates to a pharmaceutical composition comprising a liposome associated with an isolated polypeptide derived from Neisseria meningitidis strain 608B, where the polypeptide is the NBA protein. The composition is useful for inducing an immune response against N. meningitidis, for preventing and/or treating N. meningitidis infection and for treating and/or preventing neisserial infection chosen from N. meningitidis, N. gonorrhoase, N. lactamica and N. polysaccharea. It is useful for treatment or prophylaxis of meningitis and meningoccaemia, in a host. The host is a mammal, preferably a human and more preferably an adult human. The present sequence is the Neisseria meningitidis strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120

A proteinase K resistant surface protein has been of N. meningitidis (AAT33039 to AAT39042). The introduce fragments of antibodies can be used in prevention of infection by N. meningitidis or by humans. The antibodies may also be used diagnostically to detect antibodies meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNs sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)
     Neisseria meningitidis antigen, highly conserved strains - useful for prodn. of antibodies for imm diagnosis of, N. meningitidis infection.

A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells.

Disclosure; Page; 167pp; English

The invention relates to a mammalian cell receptor, useful in the creatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (APCS). Also included are a mammalian cell useful in the treatment of cancer where the receptors which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (MI) a tumourcidal immunocyte population in vio in wammal (by allowing tumour associated lipids to contact immunocyte in which creeptors for immunosuppressive fatty acids, ceramides, glycolphids, phosphosphingolipids, ganglioside, sphingolipids, glycosphingolipids and protecely colpids are inactivated or clated), a construct useful in the treatment of cancer (where an adaptor protein which into the treatment of cancer (where an adaptor protein which into the treatment of cancer (where an adaptor protein which cancer (comprising a lipid raft conjugated to a superantigen), producing (MI) a tumour associated lipids are inactivated or deleted or functionally deactivated), a composition weight in the treatment of cancer (comprising a lipid raft conjugated to a superantigen), producing cancer (comprising a lipid raft conjugated to a superantigen), producing cancer (comprising a lipid raft conjugated to a superantigen), producing context for the lipids are inactivated or deleted to produce a tumouricidal part of context for the lipids are inactivated or deleted to defect or produce a tumouricidally activated oppulation, and administering the tumouricidal and mammal by allowing a tumouricidal in which receptors for the lost), producing (MI) a tumour associated or produce a tumouricidally activated or deleted or produce a tumouricidally activated or deleted or produce a tumouricidal insumosuppressive tumour associated antigens, are deleted or produce a tumouricidal insumosuppressive tumour associated antigens, are deleted or produce a tumouricidal and antimistering libid raft conjuctors or context fusion constructs with anti-tumour proteins or motifs. The present sequence encodes an anti-tumour protein which is co-administered with or incorporated into a fusion construct with a superantispen. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from the US patnet

                                                                                                                                                                                                                                      regular activation by receptors specific for lipid-based tumour associated antigen. The receptor has cytostatic and antimicrobial properties and is suitable for use in gene therapy. The receptors, methods and compositions are useful for treating a neoplastic disease or tumour (cancer), and infectious diseases. This sequence encodes Neisseria meningitidis lipopolysaccharide (LPS) to which tumour cells develop

monoglycosylceramide or diglycosylceramide, where expression of the superantigen and the mono- or diglycosylceramide is capable of eliciting conspiration and the mono- or diglycosylceramide is capable of eliciting constitution immune response in a mammal into which the cell is introduced; (2) treating a tumor or neoplastic disease in a subject; (3) preparing a population of immunotherapeutic T or natural killer T (NKT) cells useful to treat a tumor or neoplastic disease in a subject; (4) an apoptotic cell preparation or lysate useful for treating a tumor or neoplastic disease in a subject; (4) an apoptotic cell preparation or lysate useful for treating a tumor or neoplastic disease in a subject; (4) an condensation apoptosis or lysis; and (5) a cell that has ingested to been transfected with the above apoptocic preparation or lysate, thus, cransfected with the above apoptocic preparation or lysate, thus, cransfected with the above apoptocic preparation or lysate, thus, cransfecting nucleic acid or material ingested to the immune system of methods are useful for treating tumors or neoplastic diseases. The composition of the presente a Neisseria meninglitied in classeria meninglities which induces meningococcal meningitis, which is given in the cell of this patent is not repersented in the printed appecification, but was the induced in the printed appecification, but was obtained in the present which the menunce of the present invention. Note - The sequence data for this patent is not repersented in the printed appecification, but was obtained in the present of the presen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a composition for treating a tumor or neoplastic disease in a subject. Also described: (1) a mammalian cell comprising an exogenous nucleic acid encoding a superantigen expressed in the cell, which cell also produces or expresses all alpha-anomers of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GGCGCATCCGGCTTTTACGTCCAAGCCGATGCCGCACACGCAAAAGCCTCAAGCTCTTTA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes the full length genome of Neisseria meningitidis B (NWB). The sequences in AAF2164 and AAF21607 to AAF21613 represent fragments of the NWB genomic sequence, as the sequence was too long to go in a record on it was split into 8 sequence was too long to go in a record on it was split into 8 sequences which coverlap each other at the beginning and end of each sequence by 49980 bp (1.e. the last 49980 bp of AAF21544 is repeated at the beginning of AAF21607, the last 49980 bp of AAF21569 to AAF21607 the beginning of AAF21607, and so on). AAF21545 to AAF21589 encode the Neisseria proteins given in AABS8550 to AABS853, and AAF21589 to AAF2160 represent PCR. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisseria nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions for treating or preventing infection due to Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria or of antibodies raised to Neisserial bacteria or computer storage medium or computer databases can be used in a search to computer storage medium or computer databases can be used in a search to dentify open reading frames (ORFS) or coding sequences within the NWB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Scarlato V;

ö
                             A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, antigent fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

The present invention relates to a new gram-negative bacterial bleb presenting on its surface the PorB outer membrane protein from Chlamydia trachomatis, or a protective antigen from C. pneumoniae. The invention is useful for preventing C. trachomatis or C. pneumoniae infection in a host. The present nucleic acid sequence represents a Neisseria gonorrhoeae gene as described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GGCGCATCCGGCTTTTACGTCCAAGCCGATGCCGCACACGCAAAAGCCTCAAGCTCTTTA 120

A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isolated 22 kD antigen, entigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. genorrhoeae in humans. The antibodies may also be used diagnostically to detect N.
                                                                                                                                                                                                                                                                                      AGCAAAACCTCCGCCGGCCTCGGCGTATTGGCGGGCGTAAGCTATGCCGTTACCCCGAAT 660

The isolated 22 kD antigen, antigent fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoaes in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                        The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae linfection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABZ37706-ABZ42016 represent nucleic acid molecules of the invention

A (Napa) from Neisseria meningitidis or Neisseria genorrhoeae. The invention also relates to the method of refolding an Napa protein; an alkaline refolding buffer comprising ethanolamine and SB-12 (3. dimethyldodecylammoniopropanegulphonate) for refolding an Napa protein; an dimethyldodecylammoniopropanegulphonate) for refolding an Napa protein; a carrier and optionally one or more other Neisserial antigens; a method of preventing or treating a Neisserial infection. Napa has considered for the Napa protein; and diagnosing a Neisserial infection. Napa has considered for the Napa protein; and diagnosing a Neisserial infection. Napa has contended by Neisserial antigens; a method of preventing or treating a meningitial exactines for the treatment of infections caused by Neisserial meningitials (meningococcus), which causes invasive bacterial diseases such as bacteraemia and meningitis, or Neisserial genorrhoeae, the causative agent of genorrhoeae, Recombinantly produced napa control also be used in the development of new antimicrobial agents, diagnostic tests and in drug screening. However, recombinantly produced proteins are frequently unable to adopt thair bologically active conformations, and frequently unable to adopt thair bologically active conformations, and fred may be very low due to mis-folding and aggregation of the protein. The method of the invention provides an improved method for refolding the Napa protein, and it is possible to increase the recovery of active protein form partly purified inclusion bodies in amounts up to 100% to without the need for further purification. The refolded Napa protein is useful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria general generia general amonalisating and infection caused. The
invasive bacterial disease; bacteraemia; meningitis;
Neisseria gonorrhoeae; gonorrhoea; mature protein; strain H44/76;
antibacterial; gene therapy; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New refolded Neph protein, useful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria meningitidis or Neisseria gonorrheae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated refolded Neisserial surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Poolman J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Goraj K,

Sequence 363, Application US/08961527

GENERAL INFORMATION:

APPLICANT: Charles Kunsch

TITLE OF INVENTION: Streptococcus pneumoniae Polynucleotides and Sequences NUMBER OF SEQUENCES: 391

CORRESPONDENCE ADDRESS:

ADDRESSEE: Human Genome Sciences, Inc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2659 gerricalgeaagraccagrecercegerricalgearcaagagerrecagerercaggerea 2718
